### Guided Pathways to Success: Privacy

Guided Pathways to Success is supposed to help students use the least amount of money and time to graduate but it raises questions about issues that are already familiar to us such as privacy, class, and education. Privacy is important in many different ways; personally, within the government, and academically. There is different ways in having privacy, such as public schools blocking websites and preventing students' access. Gatekeepers are a software system that withholds certain information within the person that is researching. Based off of the individuals search history gatekeepers are able to know what information to provide. For students this can be a hassle when searching for information on a course assignment, most students refer to the internet when in need of guidance or valid information. Students that usually attend a community college or public school are often looked at less than people that attend a university. For example, universities do not block websites off of the school network, but at community colleges almost everything is censored. I think everyone is entitled to their own privacy, putting people on surveillance and watching their every move may cause the person to act a different way than they normally would. Being on surveillance also may cause good behavior or act the way the person watching would want to act, or show them what they would want to see. Privacy is a huge factor with guided pathways to success it encourages students to extend their research while searching for important information on the internet.
